How is academic information produced?

Researchers discuss their work at conferences and proceedings are published.

Researchers will also write research articles for publications in journals. The articles are often peer reviewed.

Information about the article will be indexed and added to databases. The articles are often used as information sources for textbooks and eventually may appear in encyclopaedias and reference works.

Libraries buy the print publications and subscribe to the online databases. A version of the article may also be open access and freely available in institutional repositories.

Libraries organise the information so it can be found. Library users search catalogues and browse shelves to find the information that will inform their academic work and research.
